Professional summary

Ambitious and proactive Cybersecurity individual with a strong academic foundation in network security, ethical hacking, and digital forensics. Skilled in vulnerability assessment, penetration testing, and threat analysis using industry-standard tools and frameworks. Eager to apply classroom knowledge to real-world challenges through an internship in a dynamic cybersecurity environment. Known for problem-solving, attention to detail, and a commitment to learning new technologies to strengthen organizational security and resilience.

Areas of Expertise

- ✓ Information Technology
- ✓ Computer Simulations
- ✓ Cybersecurity
- ✓ Microsoft Office
- ✓ Information Security
- ✓ Firewalls
- ✓ Penetration Testing
- ✓ Programming skills
- ✓ Problem solving skills.
- ✓ Communication skills
- ✓ Teamwork
- ✓ Creativity

Education

De Montfort University	2023-
Bachelor of information Technology in cybersecurity	June 2026
H.H Shaikh Rashid Al Maktoum School, Dubai	2022
Graduated with a higher education certificate in “Computer Science.”	
Subjects: Physics, Math, Computer Science	

Experience

SOC Analyst -ITBUTLER E-Services

JAN 2026-Present

Support the SOC team in monitoring security alerts and events using tools such as IBM QRadar, Elastic Stack (ELK), and Darktrace.

Assist in the initial triage of security incidents by reviewing logs, analyzing alerts, and escalating confirmed threats to senior analysts.

Participate in basic threat hunting activities to identify unusual network behavior and potential security risks.

Help monitor firewall activity (Fortinet FortiGate) and review configuration changes under the guidance of senior engineers.

Document incidents and update tickets using the GLPI ticketing system, ensuring accurate reporting and proper follow-up.

Work closely with the Network and Security teams to support investigations and ensure security policies are followed.

Projects

Cyber-club— Participated and won the ‘SEARCH ENGINE’ a cybersecurity-based scavenger hunt game across the DMU campus. This project helped to improve my cybersecurity skills and knowledge. |March-22-2023

SolarWinds 2020 Cyberattack Analysis Project— Completed an in-depth analysis of the 2020 SolarWinds breach, including threat modelling using the Cyber Kill Chain and Attack Trees, network simulations in Cisco Packet Tracer, risk assessment, mitigation planning, and STIX-based cyber threat intelligence modelling. |Jan-27-2025

Penetration Testing Project— Performed full-scope network penetration test using Kali Linux: service discovery, vulnerability identification, exploit and post-exploit validation, and produced a reproducible penetration test report with evidence, MITRE ATT&CK mappings, and remediation recommendations. |March-30-2025

Cryptography Project— Completed individual Cryptography Project implementing a modified Affine cipher (step-by-step), performing RSA shared-modulus cryptanalysis (extended Euclidean attack), demonstrating vulnerabilities in a Needham–Schroeder key-exchange variant, and analyzing a Diffie–Hellman-style authentication scheme; delivered academic reports with calculations, attack scenarios and mitigations. |June-06-2025

Cyber Physical Systems Security Project – Investigated a simulated attack on a water treatment facility using Wireshark and Wazuh logs. Analyzed the breach from IT to OT networks, prioritized critical assets using the CARVER matrix, and mapped the attack path to the MITRE ATT&CK framework for a final incident report. |Nov-25

Malware Analysis & Exploit Research — Conducted static and dynamic analysis of various malicious artifacts to determine execution logic and infection vectors. Deconstructed a malicious PDF dropper using PDFID, uncovering obfuscated triggers used to launch embedded payloads. Employed IDA Pro to reverse-engineer

a Trojan Downloader, identifying a single-byte XOR encoding scheme (key 0xFF) used to conceal C2 infrastructure. Additionally, demonstrated stack-based buffer overflow exploitation in C, using OllyDbg to hijack the Instruction Pointer (EIP) and bypass authentication. | Jan-2026

Machine Learning NIDS Project — Developed a Network Intrusion Detection System (NIDS) utilizing a Random Forest classifier to categorize traffic into DoS, Probe, R2L, and U2R attack types. Performed exploratory data analysis and feature engineering to identify critical attack signatures, such as near-perfect correlations in SYN flood errors. The project included an assessment of simulating how attackers manipulate network features to evade detection. | May-26

Phishing Email Detection Tool (Final Year Project) — Built and deployed a calibrated machine-learning web application that classifies emails as phishing or legitimate with 98.77 % held-out test accuracy. Engineered a 5,020-dimensional hybrid feature space (5,000 TF-IDF + 20 handcrafted phishing indicators), trained a sigmoid-calibrated Logistic Regression classifier on 25,116 balanced emails, and implemented a sender-reputation allowlist override plus hard-signal escalation rule to handle BEC and brand-impersonation edge cases. Tech stack: Python, scikit-learn, Flask, joblib, Gunicorn, Railway. Live deployment at phishing-detection-tool-production.up.railway.app. | June-2026
